What is TrashPiles?

TrashPiles is a collection of 10,000 NFTs on the Solana blockchain. We are a charity based NFT project aiming to become the most environmentally friendly collection to date. TrashPiles are a mixture of both trash and treasures with 5 unique layers differentiating the NFTs from themselves. These layers consist of 1 background, 1 can, and 3 items. Varying in rarity, the combinations of layers determine rarities amongst the collection.

In a TrashPIle, items vary from things like a garden hose to a video game weapon. Our artwork is unique in a way that is also very relatable to the average

person. Whether you like video games, nature, or just really love trash, chances are there is something for you. THere are over 9 million different TrashPile possibilities. While we would love to share who designed the art, our TrashPiles artist will remain anonymous.

Our Vision

The TrashPiles NFT project has a vision of becoming the most environmentally friendly NFT project while bringing value and unique utility to reward holders. We will achieve this by making initial donations to an ocean trash cleanup charity, TeamSeas, of $5,000, $30,000, and $65,000. Not only do we have the initial donation sum of $100,000, we have built into our program a 5% royalty fee on aftermarket transactions to go directly to a charity wallet. We will provide investors and holders with one of a kind artwork and utility through innovation and continued development.

Utility

To ensure the longevity and success of the TrashPiles project, we have developed a unique utility that will, over time, lower the supply of TrashPiles, while also allowing holders to participate in what we call, the Trash to Treasure Recycle Event. This recycle event will allow TrashPile holders to mint a special Treasure Key that allows them to combine both their TrashPile and Treasure Key (burning them both) to create a very high quality and special new NFT called a TreasurePile.

Every month, a new country/region will be highlighted to be the focus of trash cleanup donations. In these highlighted areas, we will seek out local artists and bring them to light to create

unique artwork for each limited TreasurePile
collection. More info to come...

Environmental Impact

- Energy consumption from 10,000 TrashPiles minted: 19 million joules
- Kilowatt Hours (kWh) used from 10,000 TrashPiles minted: 5.1 kWh
- CO_2 emissions from 10,000 TrashPiles minted: 2.6 lbs (1.18kg)
- For reference: 19.6lbs of CO_2 are produced from burning 1 gallon of gasoline. 10,000 Ethereum transactions releases 970,000lbs of CO_2 into the atmosphere.
- Projects released on Ethereum will release 969,997 more pounds of CO_2 into the atmosphere than projects released on Solana.

How We Are Different

Integrity

TrashPiles takes pride in honoring the statement that we want to become the most environmentally friendly NFT project to date. Other projects simply cannot claim this unless they are on a carbon neutral blockchain.

Time and time again cash grabs are launched only to crash and burn. We are here for the long haul, we are here to do good, and we are here to not only create an amazing community and movement, but also create massive value to the ones who choose to follow.

Roadmap

Pre-Launch Phase

- Marketing campaign begins
- Community building
- OG Junkie private sale
  - Application phase for 100 members
  - $5,000 charity donation
- Heavy marketing
  - Influencers
  - Social media
- Whitelist Presale
  - $35,000 charity donation
- Public Mint
  - $60,000 charity donation
- Minting Completed!

Post launch phase

- Tesla giveaway to one lucky TrashPile holder!

- Post launch marketing

- Trash to Treasure Utility Announcement

Trash to Treasure phase

- Trash to Treasure utility movements begin!

- To be continued!
